

What We Understood

During our presentation, we received valuable feedback from the audience that helped us better understand the strengths and areas for improvement in our project. The audience appreciated the concept of providing on-demand stress relief through wellness vans but encouraged us to make the solution more practical and user-centric.

We realized that every feature in our project should directly address a real user need and that we must clearly explain how our solution works from the user's perspective. The discussion also highlighted the importance of anticipating user concerns and being prepared to justify our design decisions.

Suggestions We Received

The audience provided several constructive suggestions to improve our project:

- Integrate an **AI chatbot** to provide instant assistance, answer user queries, and guide customers through the application.
- Clearly explain **how the system identifies whether a user is experiencing stress**, as this is a critical aspect of our solution.
- Ensure that all proposed features are practical, feasible, and aligned with the project's objective.

What We Learnt

The presentation event was a valuable learning experience that helped us grow both technically and professionally. Throughout the event, we learned that developing a successful project involves much more than having an innovative idea—it requires thorough research, clear communication, and the ability to explain and justify every aspect of the solution.

Presenting before the audience improved our confidence and public speaking skills. We learned how to effectively communicate our ideas, answer questions with clarity, and think critically when responding to unexpected queries. The feedback we received highlighted the importance of considering the end user's perspective, ensuring the feasibility of our solution, and continuously improving our project based on expert suggestions.

Working as a team throughout the preparation and presentation also strengthened our collaboration, coordination, and time management skills. We realized the importance of

dividing responsibilities, supporting one another, and maintaining consistency in our presentation.

Overall, the event taught us that constructive feedback is an essential part of the development process. Every question and suggestion gave us an opportunity to improve our project, making it more practical, user-focused, and impactful. This experience has motivated us to continue refining our solution and has prepared us for future presentations, competitions, and real-world project development.
